TREATING LUNG CANCER

Lung cancer treatment depends on several factors, including the type, the mutations specific to the cancer, the stage of the lung cancer and your overall health. The treatment of lung cancer often requires input from radiation oncologists, medical oncologists, thoracic surgeons and lung doctors (pulmonologists).

Radiation Therapy

Radiation is a high-energy X-ray that can be used to treat lung cancer nonsurgically. It passes through the chest to treat lung cancer and can be used to treat other cancer sites, chemotherapy or both depending upon the circumstances. Radiation therapy works within cancer cells by damaging their ability to multiply. When these cells die, the body naturally eliminates them.

In early-stage lung cancer, surgery has been the standard treatment. However, in patients unable to tolerate surgery, focused radiation, called stereotactic body radiotherapy (SBRT) or stereotactic ablative radiotherapy (SABR), is a good treatment option. For large tumors or those involving lymph nodes, radiation often combined with chemotherapy may replace surgery as the main treatment. For more advanced cancers, your doctors may recommend radiation to manage symptoms such as cough, shortness of breath, pain or bleeding.

Medical Therapy

Medical oncologists specialize in treating lung cancer using various drugs. Chemotherapy means drug treatment, but there are many different kinds of medications that can be used to treat lung cancer. New research is helping oncologists learn which drugs may be most effective, and the side effects differ for each one.

Often, chemotherapy is combined with radiation therapy to make the radiation more effective. However, such combined treatment (chemoradiation) can also increase the side effects of treatment.

Types of Cancer Cells

Tumors can be a part of your treatment. Targeted therapy are drugs that work on specific types of cancer cells. Immunotherapy are drugs that work with the body's immune system. These different treatments have their own side effects. Ask your medical oncologist about what drugs may be best for you.

Surgery

Surgery offers a key part of lung cancer care. Even before treatment, surgery may be helpful in diagnosing and finding whether the cancer has spread to lymph nodes in the chest. This type of surgery is part of tumor staging or understanding how advanced the cancer may be. In early-stage tumors, surgery by itself can be curative. Your surgeon may remove part of the lung or the entire lung around the cancer. The amount of lung removed will vary based upon the tumor’s location, your health and other factors. If there are no signs of spread, additional treatment is often not needed. In more advanced tumors, surgery is sometimes replaced by radiation and chemotherapy can be combined with these treatments. Ask your surgeon or doctors whether your tumor is early and advanced and whether surgery will be helpful for you.

EXTERNAL BEAM RADIATION THERAPY

External beam radiation therapy (also called radiotherapy) is the sale delivery of high-energy X-rays to your cancer. A linear accelerator focuses the radiation beam to a precise location in your body for an exact period of time. Radiation is given in a series of daily treatments, Monday through Friday, for several weeks. In small-cell lung cancer, two treatments may be given each day. The full course of treatment varies but can span from one day to seven weeks. Before beginning treatment, you will be scheduled for a planning session to map out the treatment area. This procedure is called a simulation. You will undergo a CT scan to design your treatment and small tattoos will be made on the skin to make sure your treatments are accurate. Different techniques can be used to give radiation for lung cancer.

- Three-dimensional conformal radiotherapy (3-D CRT) combines multiple radiation treatment fields to deliver precise doses of radiation to the lung tumor. Radiation oncologists are able to tailor each of the radiation beams to focus on the tumor while protecting nearby healthy tissue.

CANCER CARE TIPS

- Avoid tight-fitting clothing that causes discomfort.
- Install fans in your home to keep the air moving, especially in hot weather.
- Stay cool by drinking plenty of fluids and wearing lightweight clothing.
- Ask your doctor or nurse about any medications, vitamins or supplements you are taking to make sure they are safe to use during radiation therapy.
- Eat a balanced diet. A dietitian may be able to help you plan meals that you enjoy and that fit your eating habits.
- Ask your doctor what chemotherapy or other treatments you can do to help you cope with cancer treatment.
- Ask your doctor what other support is available for patients dealing with cancer.
Radiation Therapy for Lung Cancer

Lung Cancer is the second most common cancer and the leading cause of death from cancer each year in both men and women. According to the American Cancer Society, approximately 230,000 Americans will be diagnosed with lung cancer annually. Cigarette smoking is the most common cause of lung cancer. However, exposure to asbestos, radon, environmental factors and secondhand smoke can cause lung cancer as well. Genetic factors can also affect risk for lung cancer.

TARGETING CANCER CARE
AMERICAN SOCIETY FOR RADIATION ONCOLOGY

ABOUT THE RADIATION ONCOLOGY TEAM
Radiation oncologists are cancer doctors who also oversee the care of each patient undergoing radiation treatment. Other members of the radiation oncology team include radiation therapists, radiation oncology nurses, medical physicists, dosimetrists, social workers and nutritionists. To locate a radiation oncologist in your area, visit www.rtanswers.org.

ABOUT ASTRO
The American Society for Radiation Oncology is the premier radiation oncology society in the world with more than 10,000 members who specialize in treating cancer with radiation therapies. ASTRO’s mission is to advance the practice of radiation oncology by promoting excellence in patient care, promoting research and disseminating research results. Visit www.astro.org for more information.
